

Introduction

This manual shows you how to use the **EnlightenDSM**'s features. This includes executing the system administration features, creating and modifying the Events tests, and using the Status Map as a visual aid in tracking and fixing system and network issues.

The system administration features comprise all the graphical user interface (GUI) options except the options on the Events menu.

The main program components and their basic functions are:

- **Configure** set up **EnlightenDSM** configuration, network pools, and program parameters, and read information about Enlighten Software Solutions.
- **User** configure user accounts and user groups; manage processes; check user security; and create new user templates.
- **Printer** configure local and remote printers; enable and disable printers; manage print queues; and manage TTY ports.
- **Network** configure and manage networks, host entries, NFS file systems, and DNS, NIS, and NIS+ servers.
- **Security** perform security checks on the system; check for obvious passwords.

- Disk observe disk utilization by groups, users, and file systems; search for files.
- Archive configure archive devices; backup and restore files; schedule backups.
- System manage cron jobs; set system clocks; manage mail aliases; observe swap space usage and more.
- Events configure Events parameters, and enable and/or use the Status Map GUI.

The rest of the chapters in this manual detail how each of the EnlightenDSM menu options works. Each main menu and its menu items are described in its own chapter.

To configure Events (test) parameters, refer to the EnlightenDSM *User Guide*. To use the Status Map, see [Chapter 10, “Events.”](#) For general details on how to install your package, navigate in the GUI, or use the PEP processor, see the EnlightenDSM *User Guide*.

License Advisory Window

There are two versions of EnlightenDSM—Advanced and Workgroup. If you are licensed for the Workgroup features, the License Advisory window will appear as shown ([Figure 1-1](#)) when you access an Advanced feature.

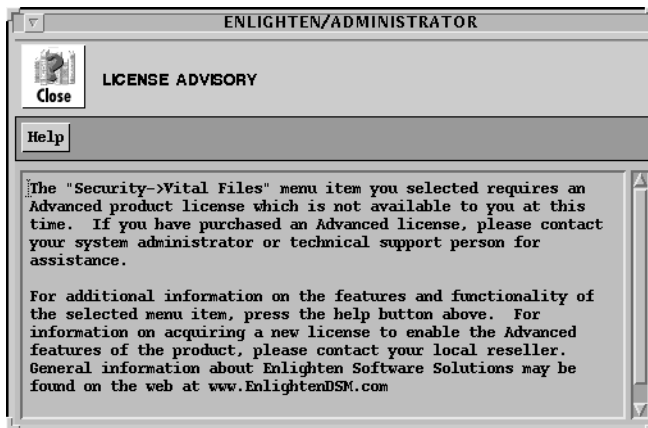

Figure 1-1 License Advisory window

The text that appears in quotation marks in the first line of the window will vary with the unlicensed Advanced Product Feature selected. For example, if the Status Map feature on the Events menu caused the License Advisory window to appear, then the text in quotation marks would be "Events->Status Map" instead of "Security->Vital Files."

If you would like to purchase EnlightenDSM Advanced Version so that you can use the enhanced features, visit Enlighten's web site for more information at <http://www.EnlightenDSM.com>.

Help Button

Click this button to view help information about the feature that caused the License Advisory window to appear. A help window will appear ([Figure 1-2](#)).
